the abstract theory of stresses, and they

had no such formulæ as are at the call of any college student to-day.

The bishop of those days was more often than not the architect of his own cathedral, and there is much evidence in the cathedrals as they stand to-day

stages of the development of the Gothic art, was experimental. He built a massive vaulted roof upon relatively slender piers and made a guess at the neces-sary diameter of piers, thickness of walls and so forth to hold his vault in place. If there were just enough ma-terial used and it were of fairly good

quality the work stood. quality the work stood.

If there were two or three times as much material as was necessary—and this, we have evidence, not infrequently happened—the work stood and all was diameter, their walls too thin or the rubble work constituting the core of the masonry was too poor in quality, down came the whole structure and the go

bishop set about rebuilding, profiting by the costly lesson he had learned. terrupted view throughout the full length of nave and choir or from transept wall to transept wall it became necessary to place great arches as tall as the roofs of the cathedral themselves at the intersection of nave and transept. Now this section of nave and transept. meant of course the cutting of hoge gaps in the walls of the tower, concenrating the weight of the upper stages of the tower, which would run up to

of the tower, which would run up to 4,000 or 5,000 tons, upon the four piers. That was a serious problem in itself; but worse than that, the effect of the huge tower load upon these arches was to produce a heavy lateral thrust, which had to be absorbed by the adjoining walls of nave and transept.

And what trouble they had? Piers would begin to buckle and would be hastily reenforced by adding to their thickness; arches would spread, causing great rents at the crown or thrusting the adjoining pier arcades out of the vertical. To remedy this and prevent disaster the builders, as at Gloucester Cathedral, would carry buttresses right down the side walls, cutting diagonally across the aisle and transept windows are sufficiently as the side walls, cutting diagonally across the aisle and transept windows are sufficiently as the side walls, cutting diagonally across the aisle and transept windows are sufficiently as the sufficient to go to Europe to this winter to join their daughter, Miss Virginia Chariton, who is making a tour of the world in company with Miss Kathleen Phillips, a schoolimate, and Miss Sherwood of Bennet's School at Millibrook. Miss Ruth Schoelkopf of Buffalo has gone to meet them for a three months' trip in the Orient.

Scoring High in Gelf.

From the Field.

A member of the Kettering Gelf Club, Mr. Sven Olssen, recently playing on the club links, struck a kestrel hawk with a teshot and killed it. This is not the first case of the kind that has been reported. During a match at Burr Hill some time ago a lady member of the club meast unexpectedly brought down a swift. When picked up it was quite dead and may be seen stuffed in the Weybridgs Museum. A swallow killed by a gelf ball was noticed in the Field of September 12, 1891, and another field of September 12, 1891, and another
